

Bean Technology Dissemination Project Beneficiary Survey in Honduras

Study Documentation (Metadata and Code Book)

July 5, 2016

Metadata Production

Metadata Producer(s)	Michigan State University, Study implementer
Production Date	July 5, 2016
Identification	N/A

About the Dataset

Description To address the critical shortage of high quality bean seed that smallholder resource poor farmers need to increase productivity, in 2010, the Dry Grain Pulses CRSP managed by Michigan State University, through funding from USAID, initiated the Bean Technology Dissemination (BTD) project focused on four countries in Central America and the Caribbean—Guatemala, Honduras, Nicaragua and Haiti. The objective of the BTD project was to enable a large number of rural families to escape poverty by introducing technologies that improved the productivity and economic viability of small-scale farms. A major focus of the BTD project was to build “seed security” in the region through the multiplication, distribution and effective storage of bean seed of improved varieties. This dataset is an output of the survey of BTD project beneficiaries conducted in Honduras in 2013 by Michigan State University: a) to understand the profiles and the household bean production economy in the BTD project areas, b) to assess the pros and cons of the availability of seeds of improved varieties distributed by the project; and c) to derive lessons on the strategy of scaling up bean seed dissemination efforts.

Sampling A two-stage randomized cluster sampling method was used to select 500 project beneficiaries. The sampling frame for this survey was the list of beneficiaries of the BTD project for 2011-12 season (cohort 2). The list included the names of 4677 beneficiaries and their locations in terms of the name of the community, municipality, and department they belong. The geographic coverage of the survey was seven Departments, five FTF priority Departments (Copán, Intibucá, Lempira, Ocotepeque and Santa Bárbara) and two non-FTF Departments (Atlántida and Yoro). These were selected based on the geographic proximity criterion and the goal of including enough communities that were targeted by both Zamorano and DICTA (BTD project partners in Honduras), which used different models of seed dissemination in the country. The goal was to survey five beneficiaries each from 100 communities (i.e., clusters) across the target regions/departments. This was done using the following three-step process. In step 1, all the communities in the selected regions/Departments that had less than five beneficiaries were eliminated from the list. In step 2, $(X_i * 100)$ communities (from the list of communities that had at least five beneficiaries) were randomly selected from each region/Department, where X (rounded to the nearest integer) represents the share of beneficiaries targeted by the BTD project in region/Department ‘i’ as a proportion of total beneficiaries across all the selected regions/Departments (such that sum of X_i across all i is 1). In step 3, five farmers were randomly selected from each of the 100 communities selected at the end of step 2. A replacement list of randomly selected farmers from within the selected communities, and from other communities within the municipality (in case all five farmers in a community were already selected in step 3) was also prepared as a backup in case any selected farmer from step 3 was not accessible at the time of the interview. The dataset includes data for 441 beneficiary farm households actually surveyed. Data set includes sample weight to reflect the share of beneficiary population at the Region level within the country.

Method: The survey was conducted by interviewing the household member that had received the bean seed from the BTD project. The interview was based on a structured questionnaire, which was translated into Spanish. The questionnaire collected information on the seed recipient (i.e. respondent) and household characteristics, bean production in the season when the BTD seed was planted, and farmers’ perception and opinion of the seed quality, varietal characteristics they liked/disliked, and the efficiency and effectiveness of the methods used to distribute the seeds. The survey was conducted by NITLAPAN of the *Universidad Centro Americana* (UCA) with technical support and supervision by this study’s Principal Investigators.

Bean Technology Dissemination Project Beneficiary Survey in Honduras

Overview

Type	Edited, anonymous dataset for public distribution
Identification	N/A
Version	v01
Kind of Data	Sample survey data [ssd]
Unit of Analysis	Households and farm plots
Language	Survey was implemented in Spanish; Dataset contains some string variables in Spanish as recorded by the enumerators
Questionnaires	Available in both English and Spanish versions

Scope & Coverage

Time Period(s)	2013
Countries	Honduras
Regional coverage:	Seven Departments -- Copán, Intibucá, Lempira, Ocotepeque, Santa Bárbara, Atlántida and Yoro

Producers & Sponsors

Primary Investigator(s)	Mywish Maredia, Byron Reyes, David DeYoung, Michigan State University
Funding Agency/ies	U.S. Agency for International Development (USAID)

Data Collection

Data Collection Dates	start 2013-08-17; end 2013-08-31
------------------------------	----------------------------------

Accessibility

Citation Requirements

- Use of the dataset must be acknowledged using a citation which would include:
- the Identification of the Primary Investigator
 - the title of the survey (including country, acronym and year of implementation)
 - the survey reference number
 - the source and date of download
